

# Sales & Supply Chain Dataset

## Objective:

The goal of this project is to analyze the sales and supply chain performance of a DataCo company by providing insights for improvement to the company.

## Why this Dataset?

Our team mainly comes from a business background, so we understand sales and supply chain processes very well. This allows us to analyze the data not just from a technical side, but also from a business perspective. So we believe that we can provide the best results and insights in this project.

## Dataset Overview:

The dataset contains 180,519 rows and 53 columns of data related to sales and supply chain operations, including product details, delivery times, shipping methods, customer details, sales information, and department details.

**Note:** The dataset contains only one fact table and nearly 0 nulls, but there is some cleaning needed and we can remodel the data to reduce redundancy and make at least 2 dim tables in addition of the fact table to make it suitable for data modeling.

## Team:

- 1- Mohamed Shehata
- 2- Youssef Tarek
- 3- Ibrahim Mohamed
- 4- Khaled Hossam
